## Question:

If the distances of  $\mathbf{P} = (x, y)$  from  $\mathbf{A} = (5, 1)$  and  $\mathbf{B} = (-1, 5)$  are equal, then prove that  $3x = 2y$ .

## Solution:

Variable	Description
$\mathbf{A}(5, 1)$	coordinates of first point
$\mathbf{B}(-1, 5)$	coordinates of second point
$\mathbf{P}(x, y)$	Equidistant point of $\mathbf{A}$ and $\mathbf{B}$

TABLE 0: Input parameters

$$\|\mathbf{B} - \mathbf{P}\|^2 = \|\mathbf{A} - \mathbf{P}\|^2 \quad (1)$$

$$\Rightarrow \mathbf{B}^2 + \mathbf{P}^2 - 2\mathbf{PB}^\top = \mathbf{A}^2 + \mathbf{P}^2 - 2\mathbf{PA}^\top \quad (2)$$

$$\Rightarrow \mathbf{P}(\mathbf{A}^\top - \mathbf{B}^\top) = \frac{\mathbf{A}^2 - \mathbf{B}^2}{2} \quad (3)$$

$$\Rightarrow \mathbf{P}\left(\begin{pmatrix} 5 & 1 \end{pmatrix} - \begin{pmatrix} -1 & 5 \end{pmatrix}\right) = \frac{26 - 26}{2} \quad (4)$$

$$\Rightarrow \begin{pmatrix} x \\ y \end{pmatrix} \begin{pmatrix} 6 & -4 \end{pmatrix} = 0 \quad (5)$$

$$\Rightarrow 6x - 4y = 0 \quad (6)$$

$$\Rightarrow 3x = 2y \quad (7)$$

$$(8)$$

Hence, proved.
